www.ACMEboom.com

ACME'S Boom Marker Lights utilize a monocrystalline solar cell and amber LED light to provide the best visibility in low light situations. These marker lights can be utilized in either temporary or long term installations and are constructed using a pendulum and roto-molded, foam-filled, solid float for long lasting performance in all weather conditions.

ACME's Boom Marker Lights are perfect for booming installations or operations that require lighted markers and needs little to no maintenance. They can be easily rigged to anchor points, oil spill containment boom, and even turbidity curtain. These lights remain extremely durable and cost effective. We can provide replacement lights in a range of colors sold separately.
