www.ACMEboom.com

ACME Seaweed Boom is manufactured to create a barrier between beaches and incoming Sargassum, seaweed, seagrass, and any other type of floating seaweed material to prevent problematic and overwhelming debris from piling up on the beach. This protects the beaches, the tourism, and marine life in areas that may be affected from these materials. It can also be used to effectively control floating trash and other types of debris. It is generally configured in 50' and 100' sections and features a permeable skirt RF welded to the float and chain pocket.

CONFIGURATION:

Our specialized seaweed boom and Sargassum barrier features a 12" diameter closed cell foam float and a 36" permeable skirt RF welded into the float and chain pockets. It also features a 3/8" chain ballast.

PERMA-BOOM:

A permanent floating oil spill barrier specially designed and built for long-term service, configured with 150oz black PVC belting and rotomolded, closed-cell foam filled floats for tougher and more damaging amounts of seaweed and debris. This construction also allows for easy replacement of floats and in-field servicing.

CUSTOMIZATION OPTIONS:

- Flotation Diameters
- Skirt Lengths
- Chain Ballast Sizes
- Fabric Types
- Top tension Cable Sizes and Types
- End Couplers
